

Mine Game

By: Dane, Shaylee, Misha

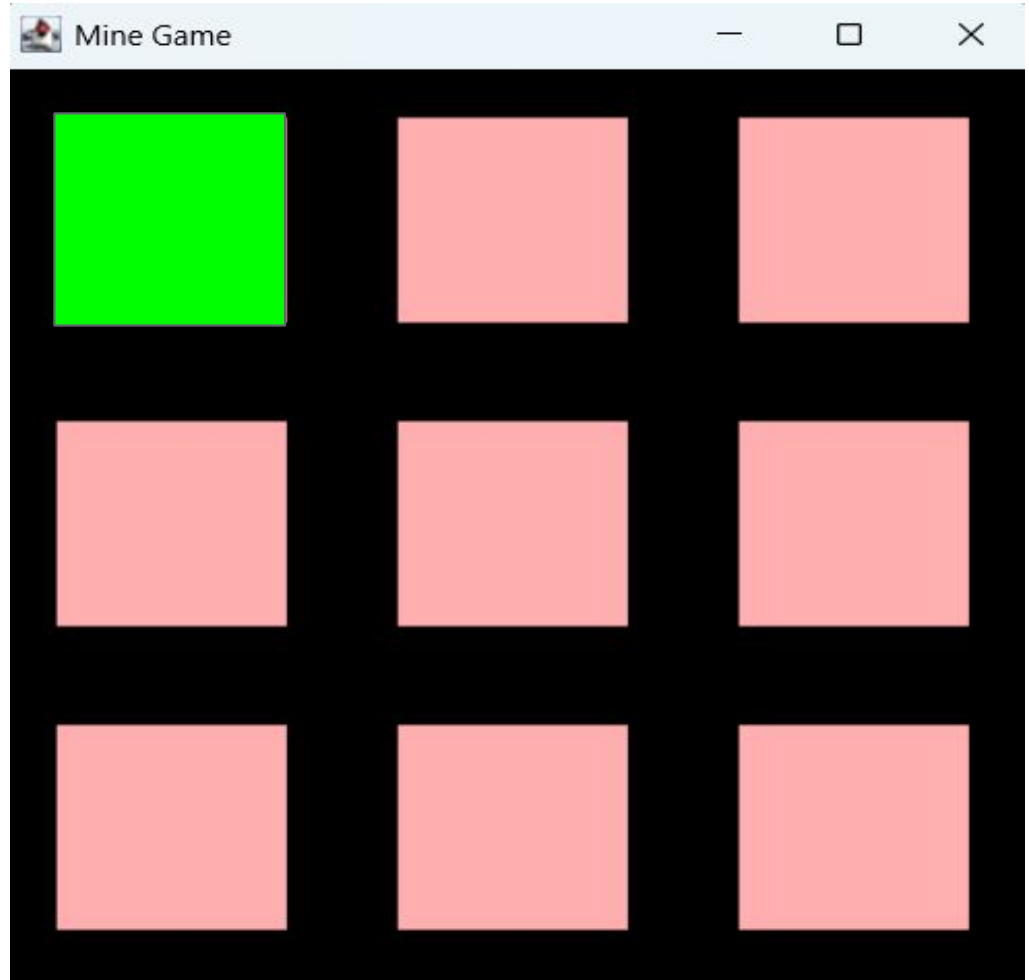

What is Mines

- Mines is a game where a 3x3 grid generates on your canvas.
- With this there are 9 tiles.
- Underneath one of the tiles there will be a bomb (the bomb is randomly placed).
- Your goal as the user is to pick 6 tiles that do not contain the bomb.
- Every correct tile you pick will turn green.
- If the bomb is struck the game ends with an explosion.
- If you win after picking 6 correct tiles game will display you win.
- Why mine Game? We wanted to have fun!

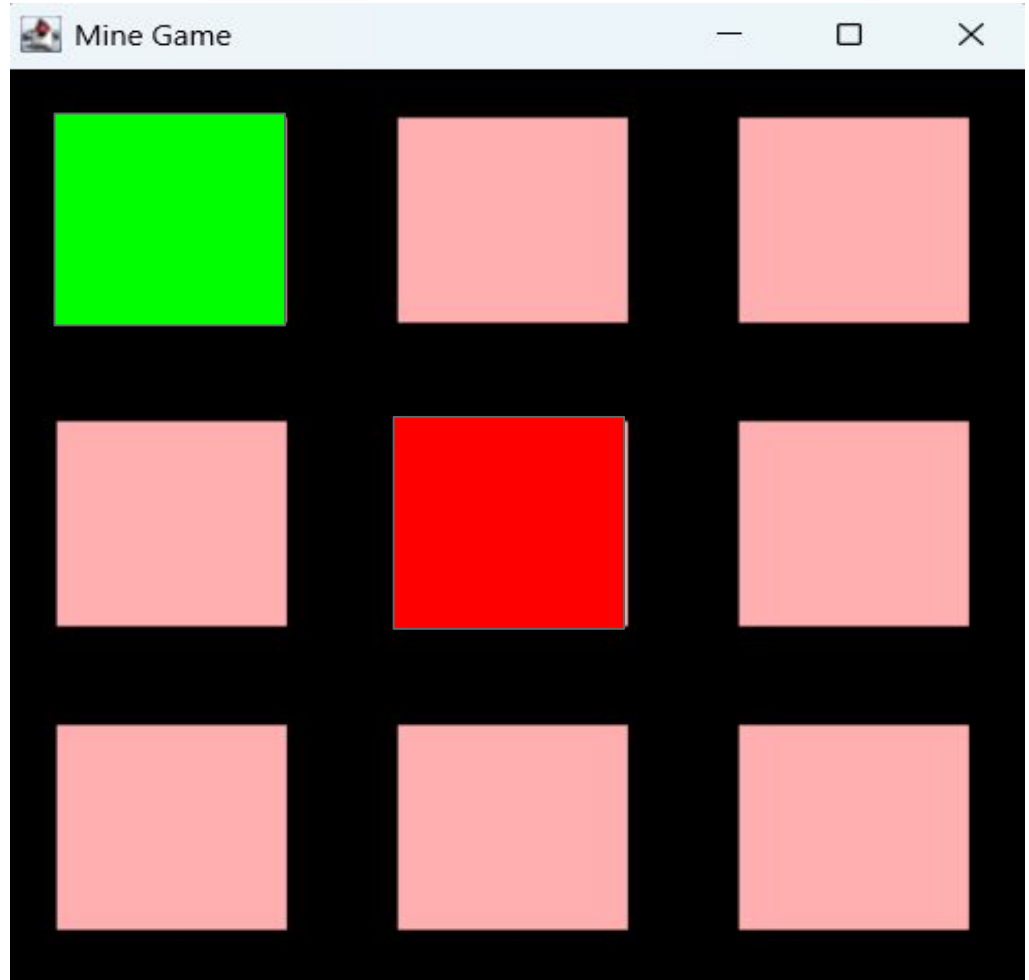

How our game looks

This is how it looks
when you click a
Safe square.

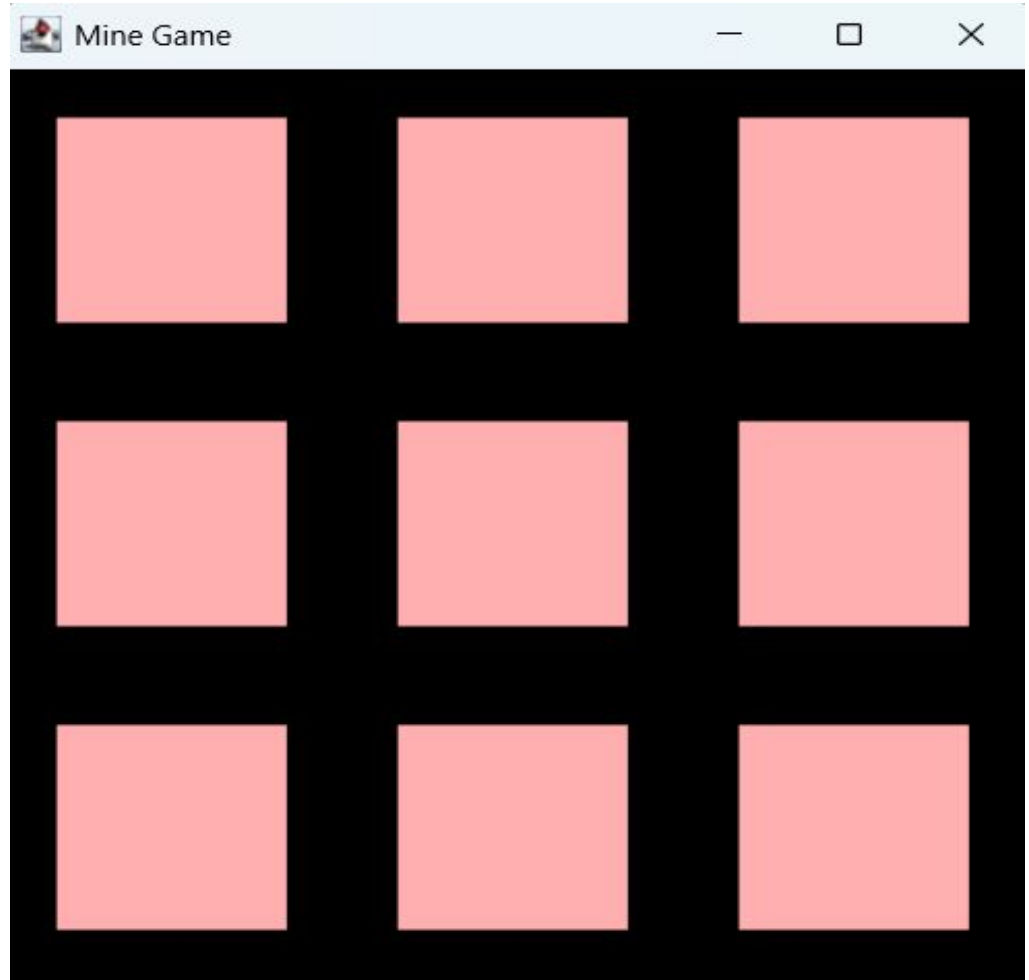

This is how it looks
when you accidentally
click a mine...

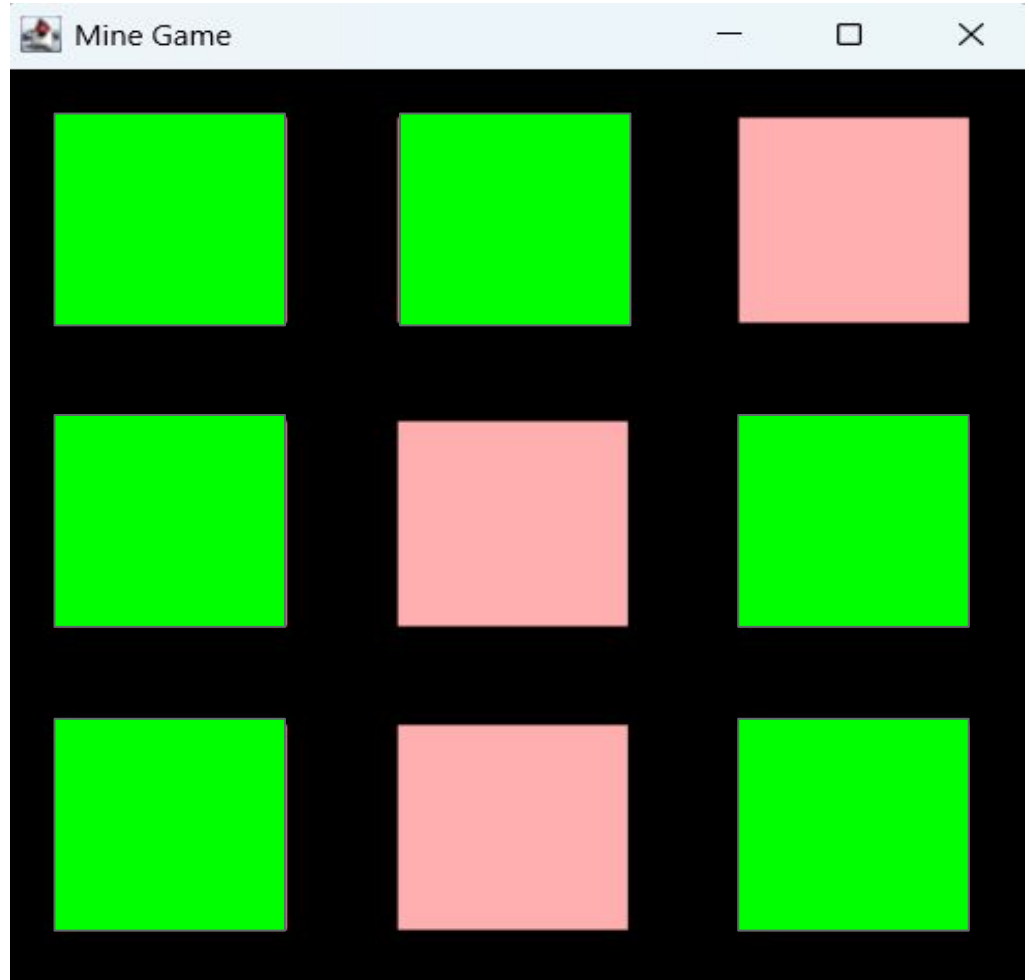

Then the canvas clears and a bomb + explosion appear :
you blew up!

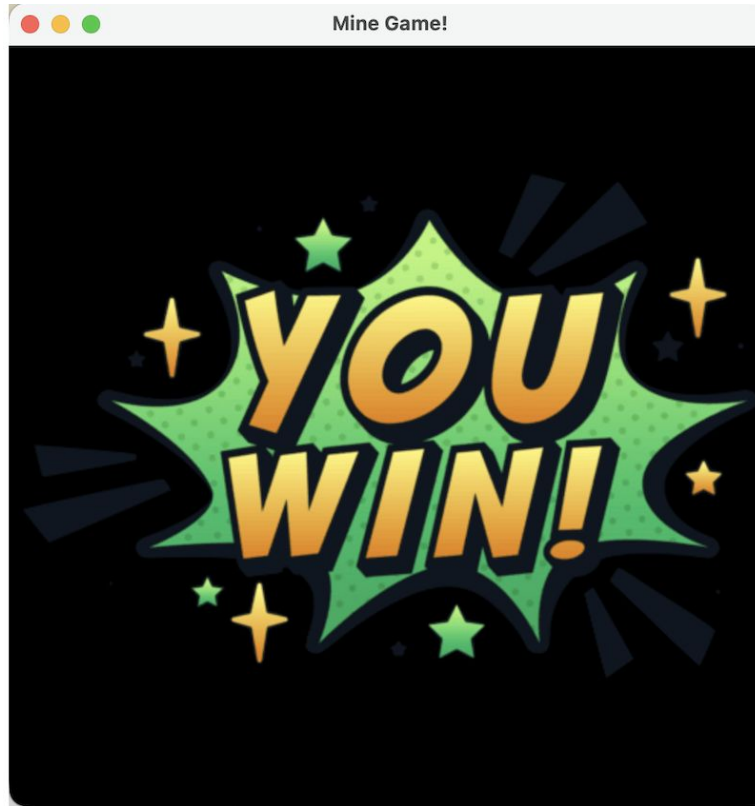

Then the game resets
to a new round.
This automatic reset
keeps the players
hooked!

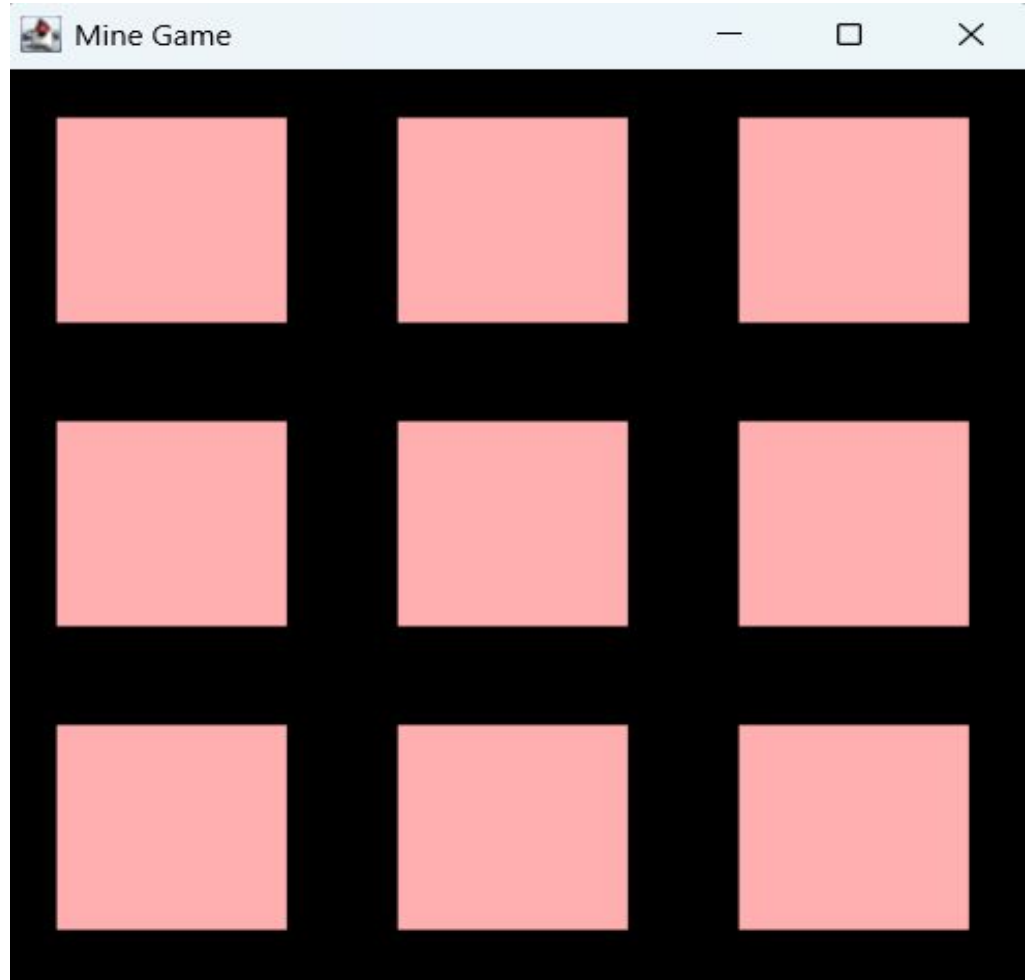

If you successfully
can click six safe
squares then you
win !

If you successfully click 6 safe tiles

Then the game resets
to a new round and
you keep playing.

Code Outline

- We have three classes
 - MineGame.java (main)
 - Line.java
 - Tile.java

```
canvas.onClick(event -> {
    System.out.println(greenCount); // just keeping this for now that we can keep checking it
    double x = event.getPosition().getX();
    double y = event.getPosition().getY();
    for (Tile t : tilesArrayList) {
        if (t.contains(x, y)) {
            t.reveal();
            canvas.draw();
            hit = true; // created a new boolean variable up top.
            if (t.isMine()) {
                t.reveal();
                canvas.removeAll();
                showBomb();
                showExplosion();
                canvas.draw();
                canvas.pause(milliseconds: 2000); // should we make it less time?
                greenCount = 0;
                reset();
            } else {
                greenCount++;
                if (greenCount == 6) {
                    System.out.println(x: "Yooooou Win"); // works but only for the first game
                    canvas.removeAll(); // -not working right
                    showCongrats();
                    canvas.draw();
                    canvas.pause(milliseconds: 2000);
                    greenCount = 0;
                    reset();
                }
            }
        }
    }
    break;
```

DEMO

Thank you!
